"CCEXtractor is an open-source utility for users who need to extract SRT file format subtitles from various video sources, including when needed to initiate batch processing, for multiple videos at once. Controlling the input and output of your data The tool enables easy input, and also allows batch video addition and processing, detailed log reviewing (resolution, aspect ratio, and framerate). It supports the following video formats: DVR-MS, M2V, MPG, TS, WTV, MP4, MPG2, VOB, and MKV. Regarding the available subtitle format, you can opt for SRT, SAMI, or VTT. Moreover, you choose from the UTF8, UNICODE, or LATIN1 available encoding options. How does the interface look and what does the app offer? CCEXtractor has a compact outlook and manages to combine simplicity with efficiency. For example, the app's dark interface is pleasant and comforting for your eyes. It also helps reduce eye strain by displaying the needed commands in a well-organized structure and by branching extended, complex configuration options under the main setup categories. The program structures its categories as it follows 'Dashboard' (the main working panel where you input and process your files, select the desired command, and choose how a command is applied via custom code), 'Basic Settings' (where you set up the input and output parameters, as well as the timing settings), and the 'Input Settings' (where you choose the desired output segmentation, manage the files as a continuous stream, and choose the input processing filters). Additionally, there are the last two sections 'Output Settings' (where you choose the desired encoding, define the output appearance, and enable/disable the output's sentence capitalization) and 'Obscure Settings' (where you set up device- and technology-specific functionality, like WTV conversion, Myth TV code branching, Picorder usage, etc.). Conclusion To summarize, CCEXtractor is an amazing application with super-fast and well-structured functioning and displaying processes. Also, the configuration options are complex and enable the creation of a laborious subtitle extraction environment."  Avaya is to remain in administration after the company's receivership agreement with French state-owned bank BNP Paribas was called off by creditors. Avaya was the world's second largest business communications provider by market share, but fell victim to the recession and competition from cheaper rival products, such as Cisco's Switch and VSP. Avaya, an IBM spin-off, went into administration in June 2010 after struggling to find investors. That put the business into receivership and halted the sale of its intellectual property. Two of Avaya's main customers have already seen their service contracts end, and the company is selling off customer data and intellectual property. BNP Paribas, which was formerly known as Société Générale, took over the business from administrator Grant Thornton earlier this month. A trustee was set up to oversee the sale of the company. The sale is expected to be completed later this year.

Q: How do I hide tags but keep a link? I have some tags that I want to have hidden, but have one I still want to be able to link to a button. I am using `display:none` for the selected option, and `display:block` for the other. The first is set using the jQuery toggle method. When the button is clicked, I would like the selected option to be changed back to `display:none` (or vice versa if there's a better way).

A: Use `.hide()` and `.show()` to toggle the selected option, e.g.

```
$('#selector').change(function() { $(this).siblings('.item').hide();
$(this).siblings('.item').show(); });
```

You may want to use the `.toggle()` function to toggle both selected and unselected items. Bridging the gap between recombinant antibody technology and cell-free protein synthesis. Antibody phage display technology continues to produce exquisite recombinant antibodies, which, however, are currently less potent than hybridoma antibodies. To improve the potency of recombinant antibodies, two distinct approaches have been adopted: one approach is to enhance the affinity of recombinant antibodies
