Q: How to share core modules between custom modules in Angular 2? I've got 3 modules like this Favorites User User Data Favorites should be an open module that can be used by other modules. User can be used in both modules, but only User Data should be shared between User and Favorites modules. Example of what I mean below: If User Data is present in my component, I should have access to `this.user = this.userService.getUser();` If User Data is present in the Favorites component, I should have access to `this.userService.loadCurrentUser();` If User Data is present in the User component, I shouldn't need to access the User Data, but instead use a fetched user from the `userService`. I cannot see a decent way of sharing User Data between User and Favorites. My current thoughts are: Pass the reference to the `UserDataService` to a shared service in the User module and use that service inside `UserComponent`. Move the `UserDataService` to the Shared module. Please let me know if you see a better way of handling this. A: Although I don't like the "global" approach, I was able to use a module which is needed in the User module, but no other module should need it (it's the service itself that needs it). Now, when we need to use a shared service, we can just include it in all components. If it's the User's data which we need to share between modules, this is what we need to do: Create a `SharedModule`

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { SharedService } from '../shared/shared.service';
@NgModule({ imports: [CommonModule], declarations: [], exports: [SharedService] })
export class SharedModule { }

```

 I like to organize my code like this, so I have a "shared" folder and share the files there. In the `UserModule`

```
@NgModule({ imports: [SharedModule ], declarations: [ UserComponent ], exports: [], providers: [ UserService ] })
export class UserModule { }

```

Q: Which file on the server should I upload in order to have my `ImageField` in Django behave like a read-only file? I'd like to include a logo in my Django project in the following way: The user uploads a logo and uploads the image to the filesystem. The user then edits the logo using the Django admin interface. This leads to the following fields being added to the model: A `FileField` (I've named it 'logo') A read-only `FileField` (I've named it 'logo_editor') If a logo is uploaded as the `logo_editor`, then it is edited (in my case, the user gets to change the colors and upload a new image). However, if the `logo_editor` is not uploaded, then I want the logo not to be editable. What should I upload? The logo or the `logo_editor`? What's the best way to get around this? A: I think the best way to do this
