How AutoCAD started AutoCAD's roots stretch back to 1960s-era vector (line drawing) and bitmap (pixel drawing) computer-aided design (CAD) software, which were proprietary, expensive, and difficult to use, and also ran on mainframe computers. In 1972, Avie Tevanian and a group of his colleagues at the University of Pennsylvania developed a new type of CAD software called Computer Drafting and Graphic System (CADG). CADG had very powerful features and was easy to use, yet was also inexpensive. A few years later, David Taylor was hired by the U.S. Department of Commerce to write a new CAD program. He implemented his own version of CADG, and then approached the Department to ask them to buy it, so they could use it at their own offices. They agreed, and Taylor's program became the U.S. Bureau of the Census' CADG-X. AutoCAD's Release and Rise to Power In November 1982, Taylor and five of his colleagues -- Joe Spencer, Steve Fink, Ken Evans, Ed Fay, and Bill Beatty -- published a paper describing the first version of AutoCAD, which became known as CADG-X. They envisioned it as a desktop app running on microcomputers with internal graphics controllers. AutoCAD was originally designed as a replacement for CADG-X. The team's program was called CADG-X II, but when the Department of Commerce decided to release the program as AutoCAD in December 1982, the name was changed. In addition to the name change, the program also became an app that ran on a microcomputer's desktop screen, and for the first time, CAD users could work at the same time on the same screen. The team licensed CADG-X to Autodesk, and Autodesk then released the software as AutoCAD. When AutoCAD was first introduced, it was priced at \$2,995, and it ran on Apple II, Atari, and IBM PC computers. That same year, Autodesk also introduced a similar program called MicroCAD, which was designed for mainframe computers running on the CDC 6000/7000 and CP-30 computers. It could only work with mainframe printers, and it was also sold for a slightly higher price of \$

2D vector graphics (2D and 3D) The 2D vector graphics support in AutoCAD is similar to the VectorWorks product. Using a combination of 2D vectors and 3D solids and surfaces, AutoCAD can be used to design any kind of 2D illustration, which can be exported to any of the following file types: DXF: This is the native CAD file format. Vector graphics (.DWG): The native format for AutoCAD. PDF: A standard format that is suitable for viewing on the Web or in a document reader. Encapsulated PostScript (EPS): PostScript can be included within the file; this enables the file to retain its vector format when viewed on screen. AutoLISP: The application programming interface used to access AutoCAD features and control AutoCAD. Visual LISP: An external.NET library used to access AutoCAD features and control AutoCAD. Version history The AutoCAD product line has evolved from its first release in 1985 as a PostScript-based 2D and 3D drafting and design application. Since then, AutoCAD has been the de facto CAD standard of the computer-aided design industry, and is used by many other software packages, such as: Adobe InDesign Adobe Illustrator Adobe Photoshop Adobe 3D Autodesk Maya Autodesk Architectural Desktop Autodesk Revit Architecture Autodesk 3ds Max Autodesk 3ds Max 2012 Autodesk Cinema 4D Autodesk Motion Builder Autodesk AutoCAD Autodesk Inventor Autodesk AutoCAD LT Autodesk Inventor Viewer Autodesk Designer AutoCAD LT Autodesk Navisworks Autodesk Smoke Autodesk 3ds Max 2012 Autodesk Infographics Autodesk Navisworks Professional The current release of AutoCAD is AutoCAD 2019. Install keygen and run it. Import the created project and let the software go through the whole process of open and close the projects etc. In the case of the Autocad Project you'll get a password, use it as you wish. Tips Open the acad.ini file from Autocad and there you can see some information about the project - like the max no of triangles that it can handle and all other information you may need. this is a market to watch. Here is my current stock portfolio. I'm in the process of selling all my gold at the moment. Thanks for the read - I have to say I'm very excited about the future. I am also looking for any information on the future of the UK miners. I haven't made any moves yet as I want to sell the gold. I have contacted various miners but they have not responded. I do have plans for the next few weeks but when the time comes I'll fill you in on them. CGT Gt, when that happens, if it does, look out for it. The odds are in favour of a double bottom/ rising wedge formation. The reaction to this probably will be negative for a while before another attempt at a bottom, I think. IF, that is, the market sees this as a real thing, of course. Originally posted by CGT GtLooks like an at least a couple of years of consolidation ahead in the gold sector. No gold discoveries for at least the next year to come. Hans I would like to add that gold is rising while the USD drops, and that some refineries that have been gold buyers for some time will move into the business of buying out of interest, especially if the price drops. I don't think there will be a lot of pull back from the current price. A lot depends on what happens with the paper currencies. If the euro goes down in value, the strong euro gold bloc will strengthen. If the dollar goes down, look for more weakness in the euro. There are no solvency problems for the financial sector, which should continue to lend to itself. I think there are too many problems in the US. I believe it has a 6 to 12 month time horizon before it gets worse, but when it does I believe it will be a crash, but a controlled one, not the kind that will be felt around the world.
