CLCL is a powerful cross-platform clipboard utility, developed by CL CLI Software. It supports a wide range of platforms, including Windows, Mac, Linux, Unix and other operating systems, and is available for free. Recently, I had a disagreement with my friend about the old one versus the new one. He claimed that Windows 10 had the best user interface ever, while I argued that it has no true innovations that separates it from Windows 8. As a result of that argument, I decided to see which is the most used operating system and the most used desktop environment in 2016. I evaluated all the available data and my findings are as follows: Most used operating system in 2016 Windows is far and away the most used operating system in 2016, with over a billion machines running it. The previous editions of Windows have dominated this market, with Windows XP, followed by Windows Vista, Windows 7 and Windows 8. The operating system is followed by the Apple OS X operating system, which is used on a majority of Mac computers and laptops. With the introduction of Windows 10, Microsoft attempted to change the way users look at this operating system by making it more user-friendly and optimized for the mobile industry. For example, Windows 10 allows you to log into your Windows device with a fingerprint instead of a password. On the other hand, I evaluated the most used desktop environments and found the following to be the most popular, in no particular order: Most used desktop environment in 2016 Ubuntu is the most used desktop environment in 2016, with about 6.8 million of the machines running this operating system. Last year, Ubuntu received a large amount of attention after the release of Ubuntu 16.04, with features like Unity and snap packages that attracted users. However, the popularity of the Linux-based operating system has been dwindling in recent years and this year is no exception. Ubuntu 16.10 comes with a new version of Unity, which looks almost identical to its predecessor. In addition, the latest release of Ubuntu includes the Snap package manager that is now replacing the apt package manager. The next most used desktop environment is Windows 10, which is the operating system used on over half of the computers in the world. Although there is a new version of Windows 10, it is a small update that includes many new features. There has also been a lot of confusion among users about the update, which has resulted in the release of many fake and malicious programs designed to steal the user's personal information
