Eset Nod32 Antivirus: save 27% at \$99.95 with your free license key! . ESET NOD32 Antivirus is the most effective antivirus offered by ESET. It is a powerful tool for safe computer protection. . This invention relates to inductive coil assemblies and in particular to inductive coil assemblies including two parts supported for relative movement or rotation. Inductive coil assemblies are used for various purposes including sensor assemblies for sensing level of molten metal in a casting ladle. Such assemblies conventionally include a probe which is rotated by an impeller in the ladle. The probe extends into the molten metal in the ladle to be subjected to the level of molten metal. Rotation of the probe causes signals to be transmitted across a gap to a receiver which is mounted on the housing of a probe holder. Such systems are disclosed, for example, in U.S. Pat. Nos. 4,467,124 (Hendry et al.) and 4,473,932 (Hendry et al.). In some of these systems the probe and probe holder are mounted to a support which is releasably latched to a side wall of the ladle. In co-pending U.S. patent application Ser. No. 09/121,815 filed Jul. 23, 1998, and assigned to the same assignee as the present application, there is disclosed and claimed an inductive coil assembly for sensing level of molten metal, the assembly having a housing for mounting and electrical signal transmission to a probe extending into a vessel, a probe holder which is supported relative to the housing for movement toward and away from the housing, and a latching mechanism releasably latches the probe holder in position with respect to the housing. The assembly also

includes an electrical communication cable between the probe holder and a receiver, one end of the cable being mounted on the probe holder and the other end mounted on the receiver. Various problems are encountered in providing the required electrical communication between a probe mounted on a probe holder of an inductive coil assembly and a receiver associated with that probe. It is considered important to provide a low impedance electrical connection between such components to minimize electrical current losses and signal distortion. Also it is important to provide a coaxial or other close-tolerance electrical connection between the two parts to avoid extraneous electromagnetic interference. However, the majority of existing inductive coil assemblies are connected in place using a threaded fastener on the probe 0cc13bf012
