The minimum specs of my board are 2mA on the power supply and 2mA on the ground. This thread almost has my function written up but i'm looking for a bit more drive. I know if i add another P-channel, how do i program it's gate to turn on my oscillator? Does "Gate On" or a specific on-time and off-time do this? OS: I am using an ATmega328 with 2 of the P-channel MOSFETs connected to an L298 and an 555 timer. A: The question is "How to drive a P-channel MOSFET as a switch" - yes, you may be able to do that. This is the ATmega328 used in the ATmega328P. If you're using the ATmega328P, do read the datasheet; it says that it will sink just 0.25mA at VDD = 5V. I guess the ATmega328 does not have a solid-state Schottky diode between internal VDD and VSS, so it will be switching with a current spike of about 2mA; this is ok. The datasheet has a note saying "This device requires low on-resistance in every state. Min-ONR_on-off (min-on-state resistance after turning-off) = $1/(1/2 * VDS)$." The on-resistance of an NMOS or PMOS at a given voltage is always an odd non-integer number of times $\$R_{DS(on)}\$$. The minimum specs of my board are 2mA on the power supply and 2mA on the ground. Then the source of the P-channel MOSFET will have no current. This thread almost has my function written up but i'm looking 6d1f23a050
