Any organism that breeds, matures, and cares for its offspring may incur fitness costs, although most that has been studied have found evidence that these costs are rather modest. In mammals, maternal effects on the offspring during gestation and lactation may have profound effects on offspring growth, behaviour, immune system development and survival. These maternal effects of relatively small size must be distinguished from those of major effects of maternal behaviour that influence survival and fertility of the offspring. In this paper, we review what is known about these maternal effects at the physiological and molecular levels in a variety of vertebrate and invertebrate species. We suggest that the effects of maternal nutrition on offspring are not only manifested through direct metabolic effects of nutrition on the developing offspring, but also through direct effects of maternal behaviour on the development of the offspring, and through indirect effects by enhanced or impeded interactions with the offspring. analysis. The investigators were free to adopt any study design they deemed appropriate. Investigators collected data from all included studies and were not blinded to the study outcomes; results may have been biased by authors' subjective judgments. Although all eligible studies were selected, some may have potentially biased outcomes due to deficiencies in study design. There were no disagreements or conflicts of 6d1f23a050
