Furthermore, the abuse of heroin and synthetic opioids (e.g. fentanyl and its analogues) is also an increasing problem. In fact, the number of deaths involving these powerful opioid pain medications has quadrupled since 1999, according to the CDC, and the number of overdose deaths involving this class of drugs is now greater than the number of deaths caused by cocaine, heroin, and methadone combined. Prescription opioid abuse can be seen as a U-shaped function of mean dosage. When the dosage is too low, patient access is limited. A low dosage cannot fully meet patient needs. If the dosage is too high, adverse reactions can result. For individuals who suffer from chronic pain and have developed opioid tolerance, an opioid pain medication dosage sufficient to offset their pain may be too high, leading to adverse reactions such as sedation, nausea, or excessive constipation. An individual's use of opioid pain medications is further complicated by the fact that treatment for other medical conditions often results in unnecessary or prolonged use of opioids. In an effort to address these needs and alleviate the adverse effects of excess opioid medication use, there have been several advances in the delivery of opioids as well as opioid antagonists. Each method of delivery (e.g., intravenous (IV), intranasal (IN), sublingual
