Field of the Invention The present invention relates to a semiconductor device and a method for manufacturing the semiconductor device. For example, the present invention relates to a semiconductor device having a capacitance element for storing information and a transistor element for executing a logical operation using a stored charge, and to a method for manufacturing the semiconductor device. In addition, in some cases, the present invention relates to a semiconductor device having a capacitance element formed by connecting a plurality of capacitance elements, and to a method for manufacturing the semiconductor device. In this specification, a semiconductor device generally means a device which can function by utilizing semiconductor characteristics, and an electrooptic device, a light-emitting display device, a power storage device, a signal processing circuit, and an electronic appliance are all semiconductor devices. 2. Description of the Related Art In recent years, attention has been paid to a technique by which a transverse electric field type transistor using a ferroelectric film is formed on a substrate having an integrated circuit formed thereon. As one application of the transistor, a memory which is formed by combining one transistor and one capacitance element which uses a ferroelectric film is known. A technique by which a ferroelectric capacitor is formed on a substrate and used as a capacitance element is known (see Patent Document 1). A capacitor in Patent Document 1 is formed of a lower electrode, a capacitance insulating film, and an upper electrode and is polarized in a first polarization direction. The capacitor is used as a capacitance element of a flash memory. A technique by which a ferroelectric capacitor is formed on a semiconductor substrate and a transistor using the ferroelectric capacitor is formed on the semiconductor substrate is also known (see Patent Documents 2 and 3). The transistor is used for forming a memory on the semiconductor substrate. Patent Document 1: Japanese Published Patent Application No. 2006-191395 Patent Document 2: Japanese Published Patent Application No. 2007-297980 Patent Document 3: Japanese Published Patent Application No. 2007-319526 When the transistor is formed using the ferroelectric film, the crystallinity of the ferroelectric film is important. Therefore, a method for manufacturing a ferroelectric capacitor capable of ensuring a sufficient crystallinity of the ferroelectric film is desired.Q:

This list has several entries and I am using an NSArrayController to make those entries editable. The problem is that after an edit of the text field and a save operation all the URIs are transformed like this:  
com.ruben.documenti/3121 com.ruben.documenti/3122 com.ruben.documenti/3123 I don't know how the text is being stored. Any idea? I have already tried with NSTextStorage and

---

NSTextAttachment but I couldn't get a result. A: This is my answer to the question. I would like to note that my approach is to use the UIDocument to create a modified version of the original document. Therefore, the UIDocument must be used as a reference when inserting attachments or modifying the original file. The other option would be to use NSMetadata but that one is a bit more complex and it doesn't give you much more flexibility. I have created a NSArrayController which is connected to a NSTextField with an NSTextStorage. The NSTextStorage is connected to a UIDocument using a UIDocumentBrowserViewController. It isn't really necessary to add the content of the NSTextStorage to the text field or any other way. In my example, I simply added a check after the NSArrayController has inserted a row into the array. NSInteger i = [arrayController.orderedObjects count]; if (i > 0) { [[arrayController.orderedObjects] removeObjectAtIndex:i - 1]; } The process I used: When the document opens (for the first time), 6d1f23a050
