(c) 07, 2011 - dimensions 2013 - Freemake VideoConverter 4.1.11 Crack.. I was so impressed. Freemake VideoConverter 4.1.11 Crack Key.Q: Using a single "if" statement on several different languages I have several JS strings that I would like to run against some other languages. My question is what is the best way to use a single string, compare it to a variable containing the data for each of these languages, and then execute the appropriate string? Lets say I have something like: if(pageLanguage == 'en'){ // do some javascript } else if(pageLanguage == 'zh'){ // do some chinese } else if(pageLanguage == 'fr'){ // do some french } else if(pageLanguage == 'nl'){ // do some dutch } I have a variable that contains the appropriate language string, e.g. "en", "zh", etc. I would like to then run through these languages and execute the appropriate strings. The strings themselves vary in length so it would be impossible to just put the strings in their entirety and just compare. What is the best way to accomplish this? A switch/case might be an option? A: Put the languages in an array, then loop through them ['en', 'zh', 'fr', 'nl'].forEach(function(lang) { if (pageLanguage == lang) { // do some code } }) Q: LINQ to SQL: How to persist select on joined table? I have 2 tables: c6a93da74d
