Access direct download links to SignTools.com cracks, serial numbers and registrations (30 day trial only). If you are a tester, please rate the task as complete (on the following scale).

Agricultural and farm field sprayers are well known for dispensing a wide variety of chemicals, including herbicides, pesticides, and fertilizers. Some types of sprayers have a plurality of spray nozzles spaced above a ground working implement, such as a tool bar or support frame. Often a wheeled trailer is provided which has a plurality of hoppers that carry the chemicals and which are emptied by the spray nozzles. The chemicals must be mixed and dispensed under a certain mixture ratio at a certain flow rate, and a certain level of efficiency is desired. The wheeled trailers are usually provided with a pump and a spray line that is connected to the pump and empties into the hopper. In some applications, a spray nozzle is connected to the dispensing line and is used with the sprayer. In other applications, the mixing valve is used with the spray line. In still other applications, the mixing valve is connected to the sprayer and an intermediary hose is connected between the sprayer and the mixing valve. Typically, an intermediary hose acts as a static flow-meter. In the event the sprayer is employed with a wheeled trailer, it is preferable that the mixer remain stationary relative to the ground working implement for optimal efficiency. When the sprayer and mixer are connected together, the mixer is typically connected to a stationary frame that is mounted on the implement. When the sprayer and mixer are connected by an intermediary hose, the hose is connected between the mixer and the sprayer, and the mixer moves together with the implement. A problem with conventional sprayers is that the pumps are sometimes air locked or coked up, and, under certain circumstances, the pump can be hard to prime. For example, the operator may have to wait and/or move the mixer closer to the implement and the nozzle. When operating with a wheeled trailer, the trailer may leave wheel marks on the field, which require a pass to repair. That is, it is necessary to have a stationary ground working implement and a hand-held device. Some farmers have multiple sprayers
